

Moeve's position and strategy regarding air emissions

HSEQ

Positioning

Air quality is both a local and global challenge caused by the emission of certain substances which, either on their own or as a result of their chemical reactions, can cause harmful effects on the environment and health.

Since Moeve's activities include processes that can generate impacts on the atmosphere, Moeve recognizes the importance of preventing and controlling its emissions into the air in order to avoid or reduce the possible harmful effects on people's health, the degradation of materials, living beings and the functioning of ecosystems.

Air emissions are mainly generated by combustion units, necessary to obtain the calorific energy required by the processes in our facilities, although there are other sources such as process and fugitive emissions.

Moeve takes the initiative to carry out its activities and face the challenges involved under the deep respect for the environment in general and the care of air quality in

particular, by mitigating the impacts on the air, reducing emissions through the use of the best available techniques and monitoring them.

Strategy

Being aware of the importance of preserving the environment, Moeve not only complies with the applicable legal requirements, but also promotes any action that contributes to the care of the environment in this order of priority:

- **Preventing** the emission of any noxious or potentially hazardous substances into the air through the use of clean fuels, the implementation of energy efficiency measures, the proper maintenance of its facilities and the adequate training of personnel involved in the operation of the processes.
- The **reduction** of emissions by applying, after an environmental cost-benefit analysis and a study of the technical-economic feasibility, the best available techniques through the use of the most appropriate technology in each case, as well as the way in which the facility is designed, constructed, maintained, operated and dismantled. In this sense, the implementation of inspection and maintenance programs for the facilities is essential to detect, prevent and correct possible sources of atmospheric emissions.
- The **monitoring** of emissions from the facilities, either by means of continuous analyzers that monitor them at all times or by means of punctual measurements carried out by Collaborating Entities of the Administration. In some cases, the air quality in the environment is also monitored by means of immission huts integrated in the administration's air quality network, which make it possible to know and transmit the information to the public and the administration in real time, as well as to establish and activate early warning protocols to avoid exceedances.

The different business units of Moeve, working together and in coordination with the professionals of the Environment, Technology and Engineering areas to adapt their facilities to the best available techniques, manage to reduce and even eliminate the emission of pollutants into the atmosphere, thus minimizing the environmental impact of Moeve on the environment.
