

Positioning and strategy on water use and management

Positioning

At Moeve, we recognize that water is an essential resource not only for life, but also for the balance of ecosystems and the well-being of communities. In line with our 2030 'Positive Motion' strategy and UN Sustainable Development Goal (SDG) 6, which calls for ensuring the availability of water and its sustainable management for all, we reaffirm our commitment to the care and responsible use of water, recognizing the universal right to access clean and safe drinking water. As part of this commitment, we assume the need to minimize our water withdrawal and maximize its efficiency in all our operations, adopting the best available technologies to promote sustainable water management.

Strategy

At Moeve, we have integrated water management as a fundamental pillar of our sustainability plan, to protect water resources and reduce the impact on ecosystems. This approach is aligned with the principles of SDG 6, which seeks to ensure the sustainable management of water and water resources, as well as adequate sanitation for all. We regularly assess the risks and the state of ecosystems in the areas where we operate, with a particular focus on water resources.

With regard to oil and gas extraction, we recognize that the extraction of water from the ground in the form of produced water is unavoidable. Therefore, we focus on reducing spills and improving the processes of reinjection of these waters to maintain reservoir pressure, prolonging their useful life and mitigating environmental risk. We also optimize the use of water in the injection of additives that improve the efficiency of our extraction processes.

Committed to the communities neighboring our operations, Moeve continually explores opportunities to share water, especially in times of drought, contributing to local well-being whenever possible and under sustainable conditions.

We also promote the application of the best available techniques to ensure that discharges from our power plants, chemical plants and other facilities strictly comply with the highest quality standards, respecting the characteristics of the receiving environment. In line with SDG 6 and 'Positive Motion', we have incorporated practices that prioritize the reduction of freshwater withdrawal, promoting savings, reuse of process water, wastewater recovery and the use of alternative sources, to ensure a more balanced and sustainable water management.

Finally, at Moeve we pay continuous attention to the water risks that affect our operations in the short, medium and long term. We analyze both basin and operational risks, using different risk scenarios. This allows us to anticipate possible impacts on our activities and to establish mitigation plans that ensure sustainable water management and the resilience of our operations in the face of variations in the availability of this essential resource.
